RESEARCH ACTIVITY

C.R. has 11 years of experience in magnetic materials and Spintronics. His activity focuses on the electric control of spin physics in heterostructures comprising semiconductors, (anti-)ferromagnets, functional oxides and others. His general aim is the discovery of novel physical properties in multifunctional materials for the realization of innovative nanoscale electronic devices. He is expert in: growth of heterostructures by molecular beam epitaxy; characterization by electron spectroscopies and diffraction (XPS, XPD, LEED, RHEED); investigation of magnetic properties (VSM, MOKE) and ferroelectricity (PFM, PUND); fabrication of devices by optical and e-beam lithography; charge/spin transport measurements.

During the Ph.D., C.R. focused studied the spin optical orientation in Germanium within Fe/MgO/Ge heterostructures, with the development of integrated spin-photodiodes able to detect the light helicity [C. Rinaldi et al., Adv. Mater. 24, 3037 (2012); C. Rinaldi, Phys. Rev. B 90, 161304(R) (2014)]. His work revealed for the first time long spin lifetime for holes under the application of a voltage bias.

He was visiting PhD at the Institute of Physics ASCR, v. v. i. (FZU), Academy of Sciences of the Czech Republic, working in the Group of Prof. Tomas Jungwirth. He studied the properties of CuMnAs, the semiconductor which paved the way to antiferromagnets spintronics [Nature Commun. 4, 2322(2013)].

C.R. worked on the non-volatile electric control of magnetization in ferroelectric/ferromagnet systems (Fe/BaTiO₃) [Nature Commun. 5, 3404 (2014); Adv. Electr. Mater. 2, 1600085 (2016)].

He pioneered the study of ferroelectric Rashba semiconductors to achieve the non-volatile electric control of spin transport in semiconductors. C.R. is author of the first spectroscopic investigation of Rashba effect in GeTe by SARPES [Adv. Mater. 28, 560 (2016)] and of the first demonstration of sizeable spin-charge conversion phenomena in GeTe [APL Mater. 4, 032301 (2016)]. He demonstrated the reversibility of the Rashba spin texture in GeTe by ferroelectric switching [C. Rinaldi et al., Nano Letters 18, 2751 (2018)] and the **ground-breaking concept of ferroelectric control of spin-charge conversion, paving the way to a new generation of fully reconfigurable computing devices based on ferroelectric Rashba semiconductors**. Finally, C.R. worked on the growth and characterization of FeY and Co/Sb₂Te₃ for the investigation of spin-to-charge conversion in topological insulators.
